Operators

Simulation

Bachelor of Information Systems
Institut Teknologi Del

Learning Objective(s)

.....

This material should address the following question(s).

- How to use operators?

Discussion Point

.....

Operators:
A Simulation.

Problem

- A book store is currently making a clearance sale.
 - The discount is gigantic, **50%**.
- To be eligible for the discount, a transaction is must be at least worth \$200 and consists of at least 2 books.

\geq \$200

and

\geq 2

both conditions must be satisfied to grab the discount.

the second requirement formed in a relational operation.

Problem

- The user will enter two values:
 - The transaction value; and
 - The number of books involved in the transaction.
- The solution will decide if the discount is applicable or not and display the decision.

Problem

- An example:
 - The user enters 300.0 for the transaction value and 3 for the number of involved books. The solution should state that the discount is applicable.

Hands On

- The 50% discount is applicable **if and only if** both required criteria are met (true).
 - Using the conjunction operator is the most suitable choice.
 - Why not using disjunction?
